Gridster.js

I decided to do gridster.js, a jQuery plugin, because making columns has always been a challenge to me. Knowing that there are plugins to make columns is a big stress reliever to me. The fact that you can make a responsive grid is a bonus in my eyes. I love how you can drag the columns (widgets) around and they stay responsive to the container they are in.

Learning how to setup gridster was fairly simple since it is very similar to bootstrap with the parameters of rows and columns. On top of gridster I learned how to apply font awesome with it! Which was just as easy as copy and paste from their website for the CDN and the icons.

Because of this project I am more confident in implementing jQuery plugins to my websites. It just takes practice!
